SIMULATED CASE STUDY / V1.0 / NOVEMBER 10, 2026

Case Study of an End to End Credentialing Workflow

This fictional case follows PRV-001, Dr. Rowan Vale, a California MD, through credential checks and an initial individual Medicare Part B application. It shows how a missing course certificate stops a submission, how a reviewer releases the hold and how the analyst closes the case after confirming the simulated decision.

All names, case evidence, dates and decisions in the scenario are synthetic. The workbooks show the queue as of November 10, 2026. Later events appear here as an illustrative continuation. Official references describe the real processes used to design the example.

November 10 workbook snapshot

Record	State at snapshot	Next action
VER-001 CA license	Simulated match dated November 6. The license review is a separate check from the NPI identity match.	Keep the dated evidence reference and monitor at the next planned review.
VER-002 NPI identity	Simulated match dated November 6. No real NPI is associated with the case.	Carry the identity check result into packet QA.
VER-003 CME documentation	Missing course completion certificate for the client's renewal-readiness review.	Request the certificate via the approved secure channel. Follow up November 12.
ENR-001 Medicare Part B	Received November 5. Pre-submission hold under the simulated client's filing gate.	Review on November 12. Leave submission, external deadline and billing effective date blank at the snapshot.

Why the file is on hold

The missing certificate blocks the fictional client's filing sign-off. The client uses the certificate for its own renewal-readiness review. The case keeps this gate separate from California's CME renewal guidance and the Medicare enrollment workflow. [S08, S14]

Ownership

The analyst owns intake, evidence reconciliation and follow-up. The reviewer signs off on the hold release and approval scope. The authorized signer certifies the submission. The enrollment and billing leads receive the verified decision and implementation scope.

Simulated Continuation and Release

The following events are future-dated relative to the workbook snapshot. Each transition depends on a recorded artifact and a named role.

2026 date	Action and evidence	Decision or handoff
Nov 12	The provider supplies the missing course certificate through the secure channel. The analyst checks the learner, date, sponsor and credit detail against the internal checklist. Reference SIM-CME-001.	The reviewer records acceptance for this client check. VER-003 clears and the ENR-001 filing hold is released after packet QA.
Nov 13	The authorized signer certifies the application. The analyst records the simulated PECOS filing receipt and timestamp. Reference SIM-PECOS-001.	Move to Submitted. Keep the billing effective date blank and schedule a status check. [S08]
Nov 16	The scenario records first furnishing of services at the approved location for purposes of the simulated effective-date example.	Keep the service start date separate from the filing date and any billing release. [S10]
Dec 4	A simulated MAC decision confirms approval for the individual and the requested location, with a November 16 billing effective date. Reference SIM-MAC-001.	Reconcile the decision to the submitted packet. Send the verified scope and effective date to the enrollment and billing leads. [S08, S10]
Dec 7	The reviewer logs the handoff and assigns ongoing license and enrollment monitoring in the client workflow.	Close the enrollment case. Track future changes and required maintenance separately. [S08]

Release evidence

The closure record contains the approved individual and location, the filing receipt, the decision date, the effective date shown in the notice, the reviewer and the monitoring owner. The later date in this example is November 16, when services first began at the new location. The analyst uses the simulated notice to confirm it. [S10]

How to replay the case

Open both workbooks and filter for PRV-001. Use a copy to advance the credential and enrollment records as evidence arrives. Use the relevant SOP for the reviewer and submission handoffs, and the email templates for the provider request and the client update.

Exceptions and Audit Review

Cases to compare with the main workflow

Scenario	Analyst action	Expected disposition
CME evidence stays missing	Follow up on the internal target date, document the contact and reassign or escalate under the sample client policy.	Keep ENR-001 on hold. Show the next owner and date.
ENR-002 has a development request	Compare the external deadline with the internal follow-up. Record the notice, requested material and current response status.	Escalate the past external deadline even though the internal follow-up is later.
ENR-003 has an approval notice with gaps	Reconcile scope and request the missing effective date through the approved payer channel.	Hold downstream release pending the verified scope and effective date.
License identity becomes ambiguous	Keep the conflicting source and submitted values. Confirm the subject with the issuing board or authorized reviewer.	Suspend affected decisions until the match is resolved and documented.

Audit questions

Can a second reviewer find the original result, the later evidence and the reason for the change? Do the intake, receipt and decision references resolve to the same case? Does the documented program, location and effective date agree with the decision? Is a monitoring owner assigned after closure?
